April, 2015

My Opinion

Nowadays, the overwhelming majority of malware and spyware infections originate from infected web pages. It is very important that you always consider whether it is safe to open given web address, especially if you received it by email, instant message or text message. Web browsing by search engine still carries risk of infected websites.

How to improve web browsing privacy and safety using Firefox web browser.

Install and Update Firefox Web Browser from <https://www.mozilla.org/en-US/> To update Firefox, click on Help menu and open About Firefox. The update should start automatically.

Then Set Firefox as your Default web browser and keep it as your default web browser.

Then you need to use Firefox if you are searching the Internet for anything or using social websites like Facebook or gaming websites. Copy all strange URLs and paste them to Firefox. If any website says you need to update some software to see something then you do that update separately from the official website or don't use that website.

https://securityinabox.org/en/firefox_main

Install Firefox Extensioin:

NoScript

Adblock Plus

BetterPrivacy

Beef Taco (Targeted Advertising Cookie Opt-Out)

WOT Web of Trust

F.B. Purity

To use NoScript, read the instructions here. NoScript is a vital part of the defense because it prevents all program scripts from running on a web page till you allow that website.

https://securityinabox.org/en/firefox_noscript

An optional but recommended add-on :

An anti-virus web page reputation and security add-on like: Avast! online security. Use an anti-malware program that has an real-time security Firefox add-on.
